## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on COP and COC Prefilled Syringes competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Prefilled syringes are a form of packaging for liquid drugs. The needle tip is pre-fixed on the syringe and the drugs are pre-filled in the container. During operation, you only need to remove the sheath for direct injection. Compared with traditional syringes, prefilled syringes have the advantages of good sealing, reduced drug contamination, accurate dosage control, higher production and use efficiency, and can reduce waste in transfer and extraction. As protein- and peptide-based drugs become increasingly popular, these drugs can adsorb or bind to the surface of glass syringes and are also more likely to be sensitive to leached components and polysorbate surfactant-derived chemicals in the glass. Therefore COP gold and COC are attracting attention as glass alternatives in prefilled form. COC and COP are relatively inert materials that minimize leaching of container components. In packaging of non-buffered water diluents, they eliminate pH changes caused by alkali leaching in the glass. Meanwhile, COC and COP offer glass-like transparency to help users check drug levels, quality and particle concentration. COP and COC Prefilled Syringes are commonly used for packaging and delivery of injectable drugs, such as vaccines, biologics, antibody drugs, etc. The design of these syringes makes the storage and use of medications more convenient and safer, and reduces the risk of cross-contamination. The unit price of COP and COC Prefilled Syringes is around \$900 to \$1,100, and the industry gross margin is between 20% and 40%. The supply chain for COP and COC prefilled syringes begins with the production of medical grade cyclic olefin resins, which are refined and formulated by specialized polymer suppliers to achieve the purity and performance required for pharmaceutical contact applications. These resins are then

processed by syringe manufacturers through precision molding, barrel forming, needle assembly, lubrication, plunger integration, and sterilization steps that create ready to fill or ready to use components. Upstream inputs include elastomeric plungers, stainless steel needles, adhesives free assembly solutions, and sterilization services that ensure compatibility with sensitive drug products. Downstream, pharmaceutical and biotechnology companies fill and package the syringes within controlled environments, after which the finished products move through wholesalers, distributors, and healthcare providers to reach hospitals, clinics, pharmacies, and home care settings. The final stage involves administration by healthcare professionals or patients, supported by regulatory oversight, cold chain logistics, and post market handling across global therapeutic markets.

The global COP and COC Prefilled Syringes market size was estimated at USD 1153.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.30% during the forecast period.
