Report Overview

Copper amalgam dental material is a restorative alloy composed primarily of mercury (approximately 50%) combined with copper, silver, and tin, used primarily in dental fillings to repair cavities and decayed teeth. It is known for its durability, cost-effectiveness, and ease of placement, making it a common choice in certain regions, particularly in developing countries where affordability is a key consideration. However, its use has declined in many developed markets due to concerns over mercury toxicity, environmental impact, and the availability of safer, more aesthetically pleasing alternatives such as composite resins, glass ionomers, and ceramic restorations. Regulatory restrictions in some countries, along with growing patient preference for mercury-free materials, have further reduced demand. Despite this, copper amalgam remains relevant in specific clinical scenarios where moisture control is challenging or where long-term wear resistance is prioritized over aesthetics. Market dynamics are influenced by regional regulatory policies, dental practitioner preferences, and advancements in alternative materials, with niche applications sustaining its limited but steady demand in certain segments.
