Abstracts

Copper rod continuous casting and rolling machine is a type of equipment used in the copper industry to produce copper rods. It combines the processes of continuous casting and rolling into a single machine, allowing for the efficient and continuous production of copper rods. Copper rod continuous casting and rolling machines are widely used in the copper industry due to their ability to produce high-quality copper rods with consistent dimensions and mechanical properties. They offer advantages such as reduced production costs, improved productivity, and better product quality compared to traditional casting and rolling methods. The growth potential of the Copper Rod Continuous Casting and Rolling Machine market is promising due to the rising need for efficient and cost-effective production processes in the copper industry. The market size of Copper Rod Continuous Casting and Rolling Machine is expected to witness growth in the coming years. From a regional perspective, the Asia-Pacific region is the main market for the Copper Rod Continuous Casting and Rolling Machine industry. This is mainly due to the promotion of economic growth and the acceleration of industrialization in the Asia-Pacific region. In the next few years, the Asia-Pacific region will play a more important role. In addition to China, the United States and Europe, Japan, South Korea, India, Southeast Asia and Australia are still important markets that cannot be ignored. The market share in Latin America, the Middle East and Africa is relatively small, but with the development of the economy and the acceleration of industrialization in these regions, the demand for Copper Rod Continuous Casting and Rolling Machine is also gradually increasing. In terms of product raw material type, Copper Rod Continuous Casting and Rolling Machines are mainly used to produce copper rods, and the raw materials of copper rods are mainly electrolytic copper and scrap copper. At present, electrolytic copper is the main type of raw material, accounting for more than 70% of the global market share. This is mainly because

electrolytic copper has high purity and stable supply. Scrap copper as a raw material type for copper rods has a relatively small market share, but with the improvement of environmental awareness and the advancement of scrap copper recycling technology, the use of scrap copper is expected to gradually increase. From the perspective of product technology type, continuous casting and rolling technology uses the heat during casting to roll into materials without interruption and heating. It has the characteristics of low raw material requirements, large output, high production efficiency, low energy consumption cost, stable quality, uniform performance, and bright surface, which brings a great change to the development of the copper industry. At present, more than 90% of the world's copper wire rods are produced by continuous casting and rolling technology. There are three main types of Copper Rod Continuous Casting and Rolling Machines: SCR method, CONTIROD method and PROPERZI method. These three methods are similar in the overall process configuration of the equipment, and only differ slightly in a certain equipment. The biggest difference between the three continuous casting and rolling methods is in the casting machine: the SCR method uses a five-wheel steel belt continuous casting machine for continuous casting; the casting machine of the CONTIROD method equipment is a double steel belt linear continuous casting machine, which has the characteristics of uniform cooling of the ingot and a large cross-sectional area; the ROPERZI method is a method of producing electrical round copper rods by fire refining technology with scrap copper. It has been applied to the process of producing fire-refined low-oxygen bright copper rods with 100% scrap copper as raw material since 1987. The Chinese market is generally later than developed countries and regions in Europe and the United States, but it can also combine the technical advantages of the three companies to develop a copper rod continuous casting and rolling production line that is more suitable for the market. From the perspective of product market application, copper rod continuous casting and rolling machines are mainly used in the production of copper rods. Copper rods are widely used in power, electronics, communications, construction and other fields. In the field of power, copper rods are used to manufacture cables and wires to transmit electrical energy. In the field of electronics, copper rods are used to manufacture electronic components such as circuit boards and radiators. In the field of communications, copper rods are used to manufacture communication cables and optical fibers. In the construction field, copper rods are mainly used in power systems, air conditioning systems, HVAC systems, etc. With the continuous development and expansion of these fields, the market demand for Copper Rod Continuous Casting and Rolling Lines is also increasing.

The global Copper Rod Continuous Casting and Rolling Machine market size was estimated at USD 173.0 million in 2025 and is projected to grow at a compound annual

growth rate (CAGR) of 3.80% during the forecast period.
