### Report Overview

Corneal bandage lenses are specialized therapeutic contact lenses designed to protect and promote healing of the cornea following injury, surgery, or in cases of certain ocular surface diseases. These lenses function as a protective barrier, shielding the damaged corneal tissue from external irritants while maintaining moisture and providing mechanical support. Unlike standard contact lenses, corneal bandage lenses are typically made from highly oxygen-permeable materials such as silicone hydrogel to ensure adequate oxygen supply to the cornea during extended wear. They are commonly used in post-surgical recovery (e.g., after photorefractive keratectomy or corneal transplants), for managing conditions like recurrent corneal erosions, or in cases of severe dry eye syndrome where the ocular surface requires stabilization. The market for these lenses is driven by the increasing prevalence of corneal disorders, advancements in ophthalmic surgical procedures, and the growing demand for non-invasive therapeutic solutions in eye care.
