Report Overview

A Coronary Drug-Eluting Stent (DES) is a medical device primarily used in the treatment of coronary artery disease. It is a small, expandable mesh tube made of metal or plastic material, designed to be implanted into a narrowed or blocked coronary artery. The stent is coated with a drug that is released slowly over time, which helps to prevent the re-narrowing or re-closure of the artery, a condition known as restenosis. The stent is inserted into the artery during a minimally invasive procedure called percutaneous coronary intervention (PCI) or angioplasty, where it is guided to the affected area using a catheter. Once in place, the stent is expanded to hold the artery open, allowing blood to flow more freely and reducing symptoms such as chest pain and shortness of breath. The use of drug-eluting stents has significantly improved the long-term success of PCI by reducing the risk of restenosis compared to bare-metal stents.

In 2024, the global Coronary Drug-Eluting Stent market is projected to reach approximately USD xx Million, with expectations to grow at a compound annual growth rate (CAGR) of around xx between 2024 and 2033.
