Abstracts

Coronary Plaque Rotational Atherectomy is a minimally invasive interventional procedure designed to treat calcified or hardened plaques in the coronary arteries. When plaque causes stenosis and restricts blood flow, traditional balloon angioplasty or stent placement may not be effective. Using a high-speed, diamond-coated burr, this procedure grinds the plaque into tiny particles, which are carried away by the bloodstream, thereby restoring proper blood flow in the coronary artery.

The global Coronary Plaque Rotational Atherectomy market size was estimated at USD 125.5 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 4.75% during the forecast period.
