Report Overview

A Coronary Stent Graft is a medical device used in interventional cardiology to treat coronary artery disease. It is a small, flexible, mesh-like tube that is implanted into a narrowed or blocked coronary artery to restore blood flow to the heart muscle. The stent graft is designed to provide structural support to the artery wall and prevent it from narrowing or collapsing again. Made from biocompatible materials such as stainless steel or polymers, it is often coated with drugs that help prevent the re-narrowing of the artery over time. The stent graft is delivered using a catheter through the groin or wrist artery, navigated to the affected coronary artery, and then expanded to fit the artery's diameter. This minimally invasive procedure is known as percutaneous coronary intervention (PCI) and is performed to alleviate symptoms, improve quality of life, and reduce the risk of heart attack in patients with coronary artery disease.
