## Abstracts

Cosmetic stability testing is a process used to evaluate the physical, chemical, and microbiological stability of cosmetic products over a period of time. It is an essential step in the development and quality control of cosmetic products to ensure their safety, efficacy, and shelf-life. During stability testing, cosmetic products are subjected to various conditions such as temperature, humidity, light exposure, and mechanical stress to simulate real-life conditions. The purpose is to assess the product's stability, including its appearance, color, odor, texture, pH, viscosity, and microbial growth. The testing typically involves storing the product samples at different temperatures and time intervals, ranging from a few weeks to several months or even years. The samples are periodically evaluated for any changes or degradation in their physical or chemical properties. This helps determine the product's shelf-life and whether it meets the required quality standards. Cosmetic stability testing is important to ensure that the product remains safe, effective, and visually appealing throughout its intended shelf-life. It helps identify any potential issues or changes that may occur over time, such as color fading, separation, microbial contamination, or loss of efficacy. This information is crucial for manufacturers to make necessary adjustments to the formulation, packaging, or storage conditions to maintain the product's stability and quality. The total size of the global beauty industry in 2022 was about US\$ 427 billion, with the sales of skin care products was about US\$ 190 billion, perfumes US\$ 70 billion, color cosmetics US\$ 80 billion, hair care products US\$ 90 billion. Head beauty and personal care companies are concentrated in Europe and the United States. More than one-third of the top 100 companies are headquartered in the United States, and 22.9% of the companies are located in France.

The global Cosmetic Stability Testing market size was estimated at USD 1344.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.50%

during the forecast period.
