Report Overview

The Coulometric Coating Thickness Measurement Machine is a precision instrument used to determine the thickness of coatings, platings, or films on substrates through electrochemical dissolution. It operates by applying a controlled current to dissolve the coating in a specific area, measuring the time or charge required for complete removal, and calculating the thickness based on Faraday's laws of electrolysis. This method is highly accurate and suitable for measuring thin or multi-layer coatings, including metals like zinc, nickel, or gold on conductive substrates. Industries such as automotive, aerospace, electronics, and manufacturing rely on these machines for quality control, ensuring coatings meet regulatory standards and performance requirements. The technology is favored for its repeatability and ability to measure very thin layers (down to nanometers), making it essential for applications where precise coating thickness directly impacts product durability, corrosion resistance, or electrical conductivity.
