Report Overview

Covalent Organic Frameworks (COFs) are a class of porous crystalline materials composed of organic building blocks linked by strong covalent bonds, resulting in highly ordered structures with tunable porosity, chemical stability, and functional versatility. These materials exhibit exceptional surface areas, uniform pore sizes, and customizable chemical functionalities, making them suitable for applications such as gas storage, catalysis, chemical sensing, drug delivery, and energy storage. COFs are distinguished by their design flexibility, allowing precise control over their structural and electronic properties through the selection of organic linkers and synthesis conditions. Their potential for high-performance applications in environmental remediation, optoelectronics, and membrane technologies has driven significant research interest, though challenges in scalable synthesis and long-term stability under operational conditions remain key barriers to widespread commercialization.
