Report Overview

The Creatine Kinase (CK) Test is a diagnostic blood test that measures the level of creatine kinase enzyme in the bloodstream. Creatine kinase is an essential enzyme found predominantly in muscle, heart, and brain tissues, playing a crucial role in the energy production process. The test is primarily used to detect and monitor muscle damage or injury, as well as to diagnose certain medical conditions such as muscular dystrophy, myositis, and myocardial infarction (heart attack). An elevated CK level may indicate muscle damage, inflammation, or injury, while a normal level suggests no significant muscle damage. The test results are typically reported in units per liter (U/L) and interpreted in conjunction with other clinical findings to provide a comprehensive understanding of the patient's condition.
