## Abstracts

Cryogenic cleaning is a non-contact surface cleaning technology that utilizes a cryogenic medium (such as liquid carbon dioxide or dry ice pellets). This method uses a high-speed jet of cryogenic medium to impact the target surface, rapidly cooling and brittle contaminants, thereby removing them and achieving efficient cleaning. Unlike traditional chemical cleaning, cryogenic cleaning does not use water or harmful solvents, avoiding residue and corrosion issues. It offers advantages such as environmental friendliness, non-destructiveness, and high efficiency. It is widely used in high-precision manufacturing, medical equipment, semiconductors, and other fields, and is particularly suitable for applications requiring extremely high cleanliness and where contact with liquids is unacceptable.

The global Cryo Dry Cleaning market size was estimated at USD 1367.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.50% during the forecast period.
