Abstracts

Cryo Electron Microscopy (Cryo-EM) technology is a technique used to preserve and examine the micro- and nanostructure of liquids and their interactions with substrates. Cryo-EM technology can obtain high-resolution structural images of biological macromolecules by freezing biological samples in liquid nitrogen and using electron microscopy under extremely low temperature conditions. These structural images can help researchers study the three-dimensional structure of macromolecules, including biomolecules such as proteins and DNA. The method is particularly valuable for studying phenomena such as emulsions, dispersions and gel-based aqueous chemical products as well as biological samples, all of which are performed at low temperatures via cryopreservation.

The global Cryo Electron Microscopy Cryo Em Services market size was estimated at USD 785.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 9.15% during the forecast period.
