Abstracts

Cryo-EM technology is a technique used to preserve and examine the micro- and nanostructure of liquids and their interactions with substrates. Cryo-EM technology can obtain high-resolution structural images of biological macromolecules by freezing biological samples in liquid nitrogen and using electron microscopy under extremely low temperature conditions. These structural images can help researchers study the three-dimensional structure of macromolecules, including biomolecules such as proteins and DNA. The method is particularly valuable for studying phenomena such as emulsions, dispersions and gel-based aqueous chemical products as well as biological samples, all of which are performed at low temperatures via cryopreservation. Cryo-EM Services usually provide a series of services, including sample preparation, data acquisition, image processing and resolution reconstruction, etc. These services can provide researchers with a full range of technical support to help them better perform cryo-EM experimental design and data analysis. The Cryo-EM Services market is experiencing a transformative phase, driven by the growing demand for high-resolution structural biology tools in drug discovery and biomedical research. This technique has revolutionized the way scientists visualize macromolecular structures, making it an essential resource for academic institutions and pharmaceutical companies alike. In my opinion, the market's momentum reflects not only technological advancements but also a broader recognition of the value of structural insights in accelerating therapeutic innovation. As accessibility improves and expertise expands, Cryo-EM is poised to become even more integral to cutting-edge research efforts globally.

The global Cryo-EM Services market size was estimated at USD 64.8 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 12.20% during the forecast period.
