Abstracts

CTLA-4 inhibitors are a type of immune checkpoint inhibitor used in cancer immunotherapy. In the treatment of cervical cancer, these inhibitors target and block the CTLA-4 protein, which normally functions to inhibit T-cell activation and immune responses. By blocking CTLA-4, these drugs enhance the immune system's ability to attack and destroy cancer cells. This approach aims to stimulate a more robust and sustained immune response against the tumor, potentially improving outcomes for patients with cervical cancer, particularly those with advanced or recurrent forms of the disease. Examples of CTLA-4 inhibitors for cervical cancer include ipilimumab, tremelimumab and cadonilimab.

The global Ctla 4 Inhibitors For Cervical Cancer market size was estimated at USD 950.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
