Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on CTP Battery Tray competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Before the emergence of power electricity in CTP technology, the manufacture of battery packs was divided into three steps of "Cell-Module-Pack". The cells were assembled into modules and then packed into battery packs. The existence of modules is to improve the efficiency of packaging cells into battery packs and facilitate maintenance. However, with the increase in the amount of electricity carried by automobiles, the number of standardized batteries is also increasing, and the number of modules is also increasing. This increases the number of components, resulting in an increase in weight and cost and a decrease in space utilization. CTP technology reduces the burden on the battery pack by reducing or even giving up the use of modules. The full name of CTP is "Cell to Pack", which skips the standard module link and directly integrates the battery cells on the battery pack, which effectively improves the space utilization and energy density of the battery pack. CTP battery trays present a trend of replacing traditional trays. Compared with traditional trays, CTP technology can reduce the manufacturing cost of power batteries. At present, the penetration rate of CTP trays is about 10-15%. The main adopters of CTP technology are BYD and CATL. It is expected that the follow-up will develop rapidly and is expected to occupy the market. In terms of value, CTP battery trays are about 100% higher than traditional trays. Advances in technology have created conditions for the development of CTP battery trays. CTP technology, also known as module-free technology, is a new type of battery tray technology, which cancels the module design and enables the battery tray to be integrated into the body as a vehicle structural part. CTP battery tray can carry and protect the power battery of new energy vehicles. Under the premise of technological progress, the development

space of the CTP battery tray industry continues to expand. Automobiles are the largest demand side of CTP battery tray, and the cumulative sales of global automobiles in 2022 will increase significantly compared with last year. The battery tray can carry and protect the automotive power battery. Driven by the market demand, its industry development space is constantly expanding. As the skeleton of the battery system, the battery tray is an important guarantee for the safety of the battery system. With the introduction of policies to stabilize automobile consumption, the sales of new energy vehicles have increased rapidly, which has also led to a substantial increase in the market size of power distribution CTP battery trays.

The global CTP Battery Tray market size was estimated at USD 2028.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 41.80% during the forecast period.
