## Abstracts

The 2025 U.S. tariff policies introduce profound uncertainty into the global economic landscape. This report critically examines the implications of recent tariff adjustments and international strategic countermeasures on Cu Pillar Bump competitive dynamics, regional economic interdependencies, and supply chain reconfigurations. Copper pillars are terminals used to flip-chip IC chips to a substrate in a semiconductor package by TCFC (Thermal Compression Flip-Chip) technology. Copper pillars are formed on aluminum electrode pads of an IC chip. Copper pillar interconnects are seeing higher demand due to an increase in pin count with fine pad pitches integrated on an IC chip. Copper pillars with dimensional uniformity can be formed on a silicon wafer by using fine plating pattern forming technology. Currently the key players of Copper Pillars include ASE (SPIL), Amkor Technology, TSMC, JCET, Intel, Samsung, SJSemi, HT-tech, Powertech Technology Inc. (PTI), ChipMOS TECHNOLOGIES, Chipbond Technology Corporation, Hefei Chipmore Technology, and Union Semiconductor (Hefei), etc. The global top ten players hold over 83 percent of global market. Driven by the exponential growth of AI, high-performance computing (HPC), 5G, and advanced mobile SoCs, CPB technology is becoming the de facto standard in fine-pitch interconnects. Its advantages in achieving higher I/O density, lower z-height, and improved signal integrity make it critical for next-generation chiplets, heterogeneous integration, and fan-out architectures. Emerging trends include sub-20µm pitch micro-bumping, lead-free CPB solutions, and integration with RDL and redistribution layer (RDL)-first fan-out processes.

The global Cu Pillar Bump market size was estimated at USD 3229.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
