Abstracts

Cube Prism Beamsplitters consist of a pair of triangular precision right angle prisms precisely glued together to minimize wavefront distortion, splitting the beam into two beams. They are bonded together on their undersides using polyester, epoxy or polyurethane based adhesives. The thickness of the resin layer is adjusted so that (for a certain wavelength) half of the light incident through one "port" (ie the face of the cube) is reflected due to FTIR (frustrated total internal reflection) and the other half is transmitted. Increasing use of beam splitters in optical measurement and experimental systems such as interferometers and spectrometers, and in several fiber optic telecommunication applications is the key driver for market expansion. In quantum computing, beam splitters are often used. High demand for beam splitters in projectors, cameras, and laser systems, along with demand for beam splitters in semiconductor and photonic instruments, is expected to drive market expansion over the forecast period. Beam splitters are lightweight and easy to construct, which is driving the market expansion. Growing applications of beam splitters coupled with advanced technologies produced by manufacturers is expected to propel the beam splitter market forward.

The global Cube Prism Beamsplitters market size was estimated at USD 202.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 16.30% during the forecast period.
