### Report Overview

Curable polymer microfluidic chips are microfluidic chips made of curable polymer materials (such as polydimethylsiloxane (PDMS), epoxy resin, polyurethane, etc.). This chip allows precise manipulation of microfluidics in micron-sized microtubes to perform various functions of traditional physical, chemical or biological experiments on micron-sized chips. Curable polymer materials have good processability and plasticity, and complex microchannel structures can be prepared through microfabrication techniques such as mold forming and photolithography. These materials can maintain stable shape and performance after curing, meeting the requirements of microfluidic chips for material stability and durability. Curable polymer microfluidic chips are widely used in many fields such as biology, medicine, chemistry, physics, etc. For example, in the field of biology, it can be used for cell culture, protein analysis, gene sequencing, etc.; in the field of medicine, it can be used for disease diagnosis, drug screening, etc.
