Report Overview

Cyclodextrin Inclusion Complex is a chemical compound formed through the interaction between cyclodextrins and guest molecules. Cyclodextrins are cyclic oligosaccharides composed of glucose units, which have a unique toroidal structure with a hydrophobic cavity and hydrophilic exterior. This structure allows cyclodextrins to form inclusion complexes with a wide range of guest molecules, typically those with hydrophobic or amphiphilic properties. The formation of these complexes can improve the solubility, stability, and bioavailability of the guest molecules, making Cyclodextrin Inclusion Complexes useful in various applications such as pharmaceuticals, food, and cosmetics. The complexation process involves the encapsulation of the guest molecule within the hydrophobic cavity of the cyclodextrin, leading to changes in the physical and chemical properties of both the cyclodextrin and the guest molecule.
