## Abstracts

Cycloplegic agents act by paralyzing the iris's sphincter muscle, causing dilation, and by paralyzing the ciliary muscle, which inhibits accommodation. Atropine, homatropine, scopolamine, cyclopentolate, and tropicamide are examples of cycloplegic agents. Preventing movement of the iris or ciliary body's dilator and sphincter muscles with cycloplegic drugs often relieves pain in inflammatory conditions such as uveitis and is a standard therapeutic procedure. Furthermore, as a result of the local release of prostaglandins, the iris usually constricts during irritation or inflammation. This makes it easier for adhesions to form with the lens. Cycloplegics also aid in the prevention of this complication. Cycloplegic drugs are muscarinic receptor blockers. Atropine, cyclopentolate, homatropine, scopolamine and tropicamide are among them. They are approved for use in cycloplegic refraction (paralyzing the ciliary muscle to determine the true refractive error of the eye) and uveitis treatment. These are the factors which is expected to grow of the market.

The global Cycloplegic Agents market size was estimated at USD 1452.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
