### Report Overview

DAS (Distributed Antenna System) and DIS (Distributed In-Building System) equipment are advanced communication technologies designed to enhance mobile network coverage and capacity within buildings or specific areas. DAS equipment consists of a network of antennas, remote units, and a central hub that work together to distribute cellular, Wi-Fi, or other wireless signals across a large area, such as a stadium or an airport. This system helps to overcome signal attenuation caused by physical structures and ensures consistent and reliable signal strength for users. On the other hand, DIS equipment is a subset of DAS technology, specifically tailored for in-building applications. It focuses on providing seamless wireless coverage within a single building or a group of buildings, such as office complexes or residential towers. DIS equipment is crucial for maintaining high-quality communication services, improving network performance, and ensuring user satisfaction in areas where traditional cellular signals may be weak or inconsistent. Both DAS and DIS equipment play a vital role in ensuring optimal wireless connectivity in today's increasingly connected world.
