Abstracts

Raised floor, also known as dissipative static floor, is a floor system composed of adjustable brackets, beams, panels and other components. The characteristic of this floor is its overhead structure, that is, there is a certain suspended space between the panel and the horizontal ground. The base material and veneer material of the raised floor are varied, including steel base, aluminum base, composite base, particle board base (wood base), calcium sulfate base, etc., and the surface is often made of anti-static glazed tiles or anti-static polished tiles to ensure the stability and durability of its anti-static performance. The design of the raised floor enables it to be grounded or connected to any lower potential point so that the charge can be dissipated. The resistance of this floor is usually between 10^5 to 10^9 ohms, which meets the requirements of anti-static technology in places such as computer rooms. The raised floor not only has anti-static function, but also has environmental protection, fire prevention, high wear resistance, high life (up to more than 30 years), high load-bearing (uniform load can reach more than 1600kg/square meter), waterproof, moisture-proof and other properties. Data centers often use Raised Floor as an air supply bellows to achieve balanced air supply and reduce pressure loss. The space under the raised floor can form a ventilation static pressure box, which is connected to the air supply outlet of the air conditioning box, so that the air flow velocity in this space is reduced to zero, the dynamic pressure is converted into static pressure, and the static pressure at each point is approximately the same, so as to achieve uniform air supply at the air supply outlet. This method not only improves the air supply efficiency, but also reduces energy consumption. The raised floor can convert part of the dynamic pressure into static pressure, so that the wind blows farther, thereby improving the comprehensive performance of the ventilation system. In the data center, the ventilation system under the raised floor is usually used in conjunction with precision air conditioning and other equipment to ensure that the environmental parameters such

as temperature and humidity in the data center reach the optimal state, thereby ensuring the stable operation of the equipment and extending its service life. The application of the raised floor also greatly simplifies the structure of the ventilation system and air conditioning system of the data center. In actual applications, it is often encountered that the ventilation duct changes from square to round, from round to square, changes in diameter, turns at right angles, and multiple pipes meet, all of which require specific pipe fittings to connect. As a universal connection platform, the elevated floor can greatly simplify the connection of these pipes, saving materials and installation time, while also facilitating subsequent maintenance and inspection work. With the development of emerging technologies such as cloud computing and big data, data centers have an increasing demand for efficient heat dissipation and wiring management, which has promoted the application of Raised Floor in this field. There is a lot of brand competition in the data center raised floor market. These companies have certain competitive advantages in technology research and development, product quality, and after-sales service. The core manufacturers of global data center raised floors include Kingspan and Changzhou Huatong Xinli Flooring, and the top two manufacturers account for about 20% of the global market share. Due to the rapid urbanization process and strong demand for information technology infrastructure construction, the Asia-Pacific region has become the world's largest data center raised floor consumer market.

The global Data Center Raised Floor market size was estimated at USD 1156.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.30% during the forecast period.
