Abstracts

Decentralized identity is an approach to identify and authenticate users and entities without a centralized authority. Identity management uses attributes such as name, birth date, Social Security number or email address to verify a person or entity to interact and transact with an online service. A digital identity is an online persona and representation of a person acting online. With centralized identity systems, identity management is often siloed by a single authority where user identity is stored and authenticated. Centralized identity can be controlled and created by a government entity. For example, a state's department of motor vehicles controls a person's driver's license identification. Centralized identity may be as basic as a username and password created on an online service. In contrast, decentralized identity lets users and organizations manage and control their identity in a distributed approach. Rather than relying on a siloed identity provider, the decentralized model relies on a Web 3.0 approach, using distributed ledger technology (DLT), including blockchain, and storing information in a digital wallet. Decentralized identity should not be confused with federated identity or single sign-on approaches to identity and access management. With those approaches, a centralized identity service enables a user identity to be shared across multiple applications in different locations. The decentralized identity does enable the single user identity to be accessed by different sites and services to authenticate an identity stored in a digital wallet.

The global Decentralized Digital Identity Systems market size was estimated at USD 946.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 82.50% during the forecast period.
