### Report Overview

Decitabine for Injection is a pharmaceutical product designed for intravenous administration. It is a type of chemotherapy medication that belongs to the class of drugs known as DNA methyltransferase inhibitors. Decitabine functions by incorporating itself into the DNA of cancer cells, which then inhibits the action of the enzyme DNA methyltransferase. This enzyme is responsible for adding methyl groups to DNA, a process that can silence tumor suppressor genes and contribute to cancer development. By inhibiting DNA methylation, Decitabine helps to reactivate these silenced genes, potentially restoring their normal function and halting cancer cell growth. The product is typically used in the treatment of certain types of leukemia and may also be utilized in clinical trials for other cancer types. It is crucial for healthcare professionals to follow the prescribed dosage and administration guidelines to ensure the safety and efficacy of the treatment.
