Abstracts

Crystalline graphite is in the shape of scales and thin blades. The size of the scales is generally (10-20) mm × (0.5-10) mm, with a maximum of 4-5 square millimeters, and a thickness of 0.02-0.05 mm. The larger the scales, the higher the economic value. Graphite wafers are mostly distributed in the rock in a disseminated or gneissed shape, with obvious directional arrangement, consistent with the layer (flake) structure; the content is generally 3% to 10%, with a maximum of more than 20%. The fixed carbon content is low and the selectivity is good. Flake graphite has better lubricity, plasticity, heat resistance and electrical conductivity than other graphites. Crystalline graphite is divided into four categories according to its fixed carbon content: high-purity graphite, high-carbon graphite, medium-carbon graphite and low-carbon graphite.

The global Deep Processing Of Crystalline Graphite market size was estimated at USD 385.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.75% during the forecast period.
