Abstracts

Defective Microstrip Structure Filter (DMS Filter) is a filter designed based on Defective Microstrip Structure (DMS). Defective microstrip structure filters are filters formed by etching periodic or non-periodic defect structures on metal microstrip lines. These defect structures can change the electromagnetic characteristics of the microstrip line, thereby producing a band-stop effect within a specific frequency range and achieving effective filtering of the signal. The working principle of the DMS filter is mainly based on the influence of the defect structure on the microstrip line on the propagation characteristics of electromagnetic waves. When electromagnetic waves propagate on the microstrip line, reflection, scattering and other phenomena will occur when encountering defect structures, causing changes in the transmission characteristics of the electromagnetic waves. By reasonably designing the shape and size of the defect structure, the transmission of electromagnetic waves can be suppressed within a specific frequency range, thereby achieving a filtering effect.

The global Defected Microstrip Structure Filter market size was estimated at USD 28.42 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
