Report Overview

Defibrinated Blood is a type of processed blood product that has undergone a specific treatment to remove fibrinogen, a protein responsible for blood clotting. This process is typically achieved through the addition of enzymes or chemicals that break down fibrinogen, resulting in a liquid blood product devoid of clotting ability. Defibrinated blood is used in various medical, research, and industrial applications, such as in the production of certain diagnostic tests, research experiments, and as a component in the manufacturing of certain pharmaceuticals. The defibrination process ensures that the blood remains in a liquid state, facilitating its use in these applications without the risk of clot formation.
