Report Overview

A degassing agent is a specialized chemical compound or substance designed to remove dissolved gases, primarily oxygen and carbon dioxide, from liquids, particularly water. It plays a crucial role in various industries, such as water treatment, beverage production, and industrial processes, where the presence of dissolved gases can lead to issues like corrosion, oxidation, or poor product quality. The degassing agent works by either chemically reacting with the dissolved gases to form non-gaseous byproducts or by promoting the release of gases from the liquid through physical means, such as creating a vacuum or increasing the liquid's temperature. This process helps to improve the efficiency of operations, enhance product quality, and extend the lifespan of equipment by reducing the corrosive effects of dissolved gases.
