Report Overview

Dehydrated forage refers to a type of feed product that is derived from various plant materials, typically grasses or legumes, which are used as a primary source of nutrition for livestock, particularly ruminants like cattle, sheep, and goats. This product undergoes a dehydration process to remove moisture content, which helps in preserving the forage and extending its shelf life. The dehydration process can be achieved through various methods such as sun-drying, mechanical drying, or freeze-drying. The resulting product retains most of the nutritional value of the original forage, including proteins, fibers, and essential minerals, while also being lightweight and easy to transport.
