Report Overview

A dehydration alarm is a device or system designed to alert individuals when they are at risk of dehydration. Dehydration occurs when the body loses more fluids than it takes in, resulting in a depletion of essential fluids and electrolytes needed for normal bodily functions. Dehydration alarms typically work by monitoring certain indicators in the body, such as urine color, sweat rate, body temperature, heart rate, or other physiological markers. When these indicators suggest that the individual is becoming dehydrated, the alarm will trigger an alert to remind the person to drink more fluids and prevent further dehydration.
