Report Overview

Dental diamond material burs are precision instruments used in dentistry for cutting, grinding, and polishing hard tissues like teeth and bones, as well as restorative materials such as ceramics and composites. These burs consist of a stainless steel or tungsten carbide shank coated with diamond particles, either bonded via electroplating or sintering, ensuring durability and high abrasion resistance. The diamond grit size varies (coarse, medium, fine, or extra-fine) to suit specific clinical applications, from rapid tooth reduction to fine finishing. Their superior cutting efficiency, minimal vibration, and ability to maintain sharpness longer than traditional carbide burs make them indispensable in restorative, prosthetic, and surgical dental procedures. Advances in manufacturing, such as nanodiamond coatings and improved bonding techniques, have further enhanced their performance, catering to the growing demand for minimally invasive and high-precision dental treatments.
