### Report Overview

Deoiled soy lecithin is a byproduct obtained during the refining of crude soy lecithin, where most of the oil content is removed, resulting in a high-phospholipid powder or granule. It is widely used as an emulsifier, stabilizer, and dispersing agent in food, pharmaceuticals, and industrial applications due to its excellent functional properties, such as improving texture, extending shelf life, and enhancing nutrient absorption. The product is valued for its non-GMO and organic variants, catering to the growing demand for clean-label and natural ingredients. The global market for deoiled soy lecithin is expanding, driven by increasing applications in functional foods, dietary supplements, and animal feed, alongside rising consumer awareness of health benefits associated with phospholipids. However, competition from alternative emulsifiers like sunflower lecithin and fluctuating soybean prices pose challenges.
