### Report Overview

A depth filtration system is a filtration process that involves passing a fluid through a porous medium, typically a thick layer of filter material, to capture and remove contaminants. Unlike surface filtration, where particles are primarily trapped on the surface of the filter medium, depth filtration allows particles to penetrate and be retained throughout the depth of the filter material. This results in a higher dirt-holding capacity and greater efficiency in removing a wide range of contaminants, including particles, sediments, and microorganisms, from liquids or gases.
