Report Overview

Derotation Instruments are specialized surgical tools designed to correct rotational deformities in bones, particularly in orthopedic procedures. These instruments are typically used by orthopedic surgeons to realign bones, such as in the case of fractures, congenital deformities, or post-traumatic conditions. Derotation instruments function by applying controlled rotational forces to the bone, allowing the surgeon to precisely adjust the bone's alignment. They often consist of a handle, a shaft, and a specialized tip or attachment that interfaces with the bone. The design of these instruments may vary, but they all aim to provide a stable and secure grip on the bone while allowing for fine-tuned adjustments. Derotation Instruments are an essential part of orthopedic surgery, enabling surgeons to achieve optimal bone alignment and improve patient outcomes.
