Report Overview

A diaphragm blower, also known as a diaphragm pump or a membrane blower, is a type of positive displacement blower that uses a flexible diaphragm to generate air or gas flow. It operates by using the movement of a diaphragm to create suction and compression cycles, which result in the transfer of air or gas. The diaphragm blower consists of a housing or casing that houses the diaphragm and related components. The diaphragm is typically a flexible membrane made of rubber or elastomer material. It is positioned between two chambers within the blower housing. As the diaphragm moves back and forth, it changes the volume of the chambers, thereby creating suction and compression actions.
