### Report Overview

Diaphragm Dispensing Valve (Diaphragm Dispensing Valve) is a dispensing device used to precisely control liquid or semi-solid materials (such as glue, liquid sealant, etc.). It usually consists of a valve body and a diaphragm. The valve body is provided with a channel to control the flow of liquid, and the diaphragm is responsible for controlling the switch of the liquid. Diaphragm dispensing valves are pneumatically or electrically driven. By applying or releasing pressure to the diaphragm, the control switch on the diaphragm is opened or closed to control the flow of liquid. When the diaphragm is open, the liquid flows out through the channel of the valve body; when the diaphragm is closed, the liquid stops flowing. In this way, by controlling the switch state of the diaphragm, precise dispensing operations can be realized, including controlling the flow rate, speed, interval and other parameters of dispensing. Diaphragm dispensing valves are widely used in many different industries such as electronics, automotive, medical devices, aerospace, etc., for a variety of dispensing tasks including line dispensing, dot matrix dispensing, dispensing and sealing, etc. It has the advantages of precise control, high reliability, and suitability for high-viscosity liquids, and is widely used in various production environments.
