Report Overview

Dibasic Lead Stearate (DBLS) is a chemical compound primarily used as a stabilizer in the production of polyvinyl chloride (PVC) plastics. It is derived from the reaction of lead oxide with stearic acid, resulting in a lead salt with the chemical formula $Pb(C_{18}H_{35}O_2)_2$. DBLS plays a crucial role in PVC formulations by preventing the thermal degradation of PVC during processing and improving the stability of the final product. It is particularly effective in rigid PVC applications such as pipes, profiles, and injection-molded parts. DBLS is also known for its lubricating properties, which can aid in the processing of PVC by reducing friction and facilitating easier flow during extrusion or molding. Despite its benefits, the use of DBLS has been subject to scrutiny due to environmental and health concerns related to lead exposure, leading to a search for alternative stabilizers in some applications.
