### Report Overview

Dichloroethane (DCE), also known as ethylene dichloride (EDC), is a chlorinated hydrocarbon primarily used as an intermediate in the production of vinyl chloride monomer (VCM), which is further processed into polyvinyl chloride (PVC), a widely used plastic. DCE exists in two isomeric forms: 1,1-dichloroethane and 1,2-dichloroethane, with the latter being more commercially significant due to its role in PVC manufacturing. The chemical is also utilized as a solvent in industrial applications, including adhesives, pharmaceuticals, and textiles, though its use in these areas has declined due to environmental and health concerns. The market for DCE is heavily influenced by the demand for PVC, which is driven by construction, automotive, and packaging industries. Major producers are concentrated in regions with strong petrochemical infrastructure, such as North America, Asia-Pacific, and the Middle East, with China being a key player due to its large PVC manufacturing base. Regulatory pressures, particularly regarding environmental and workplace safety, along with the shift toward sustainable alternatives, are shaping market dynamics, though DCE remains essential in PVC production for the foreseeable future.
