Abstracts

Die attach compounds are materials used in the assembly of semiconductor devices to attach a die to a substrate, such as a leadframe or a printed circuit board. These compounds are used to bond the die to the substrate, and typically contain a filler material such as silver, copper, or aluminum, mixed with a resin or adhesive. The compound must have a high thermal conductivity to help dissipate heat generated by the device, and must also provide good adhesion and electrical conductivity. Die attach compounds are often applied to the substrate by dispensing, stenciling, or screen printing, and are then cured by heat or ultraviolet light.

The global Die Attach Compound market size was estimated at USD 1669.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.20% during the forecast period.
