### Report Overview

A diesel radiator is a radiator used in diesel engines, also known as a diesel engine radiator. It is part of the diesel engine cooling system, and it keeps the engine within the normal operating temperature range by lowering the cooling water temperature. A diesel engine generates a lot of heat when it is working, and this heat needs to be dissipated through the radiator to ensure the normal operation of the engine. A diesel radiator is usually made of materials such as copper, aluminum, brass or plastic, installed on the main pipeline in the engine cooling system, and connected to the cooling fan through a bypass pipeline. When the diesel engine cooling water temperature rises, the cooling fan will automatically start to dissipate heat.
