## Abstracts

Dietary fibres, also known as roughage, are indigestible complex carbohydrates found in a variety of foods such as fruits, vegetables, nuts, lentils, and grains. Dietary fibres are classified into two types: soluble and non-soluble. Both types aid in the proper functioning of the digestive system. Soluble fibres promote satiety, aid in weight loss, and regulate the body's cholesterol and blood sugar levels. Insoluble fibres, on the other hand, absorb water to normalise bowel movements and ensure proper stomach and intestine function. Dietary fiber is extracted from different sources by wet, dry, chemical, gravimetric, physical, enzymatic and microbial methods. Combinations of the above methods can also be used to achieve the desired result. Different processing methods produce different results on the structure of dietary fiber. Innovations in production processes and high potential for dietary fiber to be used in various food products are expected to drive the market demand.

The global Dietary Fibres in Food market size was estimated at USD 8058.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 8.70% during the forecast period.
