Report Overview

A Diffusion Silicon Pressure Sensor is a type of pressure transducer that utilizes silicon as the primary material for its sensing element. It operates on the principle of piezoresistive technology, where the resistance of the silicon changes in response to applied pressure. This change in resistance is then converted into an electrical signal, typically a voltage or current output, which can be used to measure pressure. The diffusion process in the name refers to the method used to create the piezoresistive elements within the silicon, which involves diffusing impurities into the silicon to form a resistor network sensitive to mechanical stress. These sensors are known for their high sensitivity, accuracy, and stability, making them suitable for a wide range of applications, including industrial process control, automotive systems, and medical equipment, where precise pressure measurement is critical.
