Report Overview

Digital Active Phased Array Radar (DAPA) is a sophisticated radar system that employs advanced digital technology and phased array principles to enhance its performance. This radar system is characterized by its ability to electronically steer the radar beam without the need for mechanical movement, which is achieved through the use of multiple antenna elements that are individually controlled. The digital aspect of DAPA refers to the use of digital signal processing techniques to manage the radar signals, allowing for greater flexibility in beamforming, target detection, and tracking. This technology enables the radar to adapt to various operational scenarios, such as air defense, missile defense, and surveillance, by rapidly changing the direction and shape of the radar beam. The digital active phased array radar offers improved accuracy, faster response times, and increased reliability compared to traditional radar systems, making it a critical component in modern defense and aerospace applications.
