Abstracts

The Digital Cervical Lumbar Traction Machine is a medical device used for the treatment of cervical and lumbar spine conditions. It is designed to provide traction therapy, which involves the gentle stretching and decompression of the spine to relieve pain, reduce pressure on spinal discs, and promote healing. The machine typically consists of a digitally-controlled traction unit, straps, and a harness that secures the patient in place during the treatment. It utilizes advanced technology to apply controlled traction force to the cervical (neck) or lumbar (lower back) region, depending on the specific needs of the patient. The traction force can be adjusted based on individual requirements, and the treatment duration and intensity can also be customized. During the treatment session, the patient lies down and is comfortably secured to the machine. The traction unit then applies a pulling force to the patient's spine, gradually stretching and decompressing the targeted area. This helps to create space between the spinal discs, alleviate pressure on nerves, improve blood flow, and promote the movement of nutrients to the affected area. The machine allows healthcare professionals to monitor and control the treatment parameters using a digital interface.

The global Digital Cervical Lumbar Traction Machine market size was estimated at USD 125.4 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.85% during the forecast period.
