Abstracts

Digital image correlation (DIC) is a non-contact optical measurement technique that determines full-field displacements and strains on an object's surface by analyzing images captured during deformation. DIC systems are widely used in materials testing, structural analysis, biomechanics, and aerospace engineering due to their versatility, accuracy, and ability to measure complex deformations without physical contact with the specimen. In 2024, the global production of digital image correlation (DIC) systems will reach 49,400 units, with an average selling price of US\$31,428 per unit. The upstream industries of digital image correlation (DIC) systems mainly include core hardware suppliers such as high-resolution industrial cameras, precision lenses, LED or laser light sources, image acquisition cards, three-dimensional calibration plates and high-performance computing chips, as well as software technology companies that provide image processing algorithms and finite element analysis interfaces. The accuracy of their components and algorithm capabilities directly determine the measurement performance of the system; the midstream is DIC system integrators and software developers, who are responsible for hardware integration, system calibration, and software platform development (such as 2D/3D strain calculation and dynamic analysis modules) to form standardized or customized solutions; the downstream is widely used in materials science, aerospace, automobile manufacturing, civil engineering, biomechanics and intelligent manufacturing. Users include scientific research institutions, universities, testing laboratories and industrial enterprises. With the growth of demand for high-end manufacturing and structural safety monitoring, downstream applications continue to expand, driving the industrial chain towards high precision, intelligence, real-time and localization. After years of development, digital image correlation (DIC) systems have matured and are currently widely used in fields such as materials science, mechanical testing, aerospace, and the automotive industry. The technology continues to optimize towards high-precision, full-field, and non-contact

measurement, and modern systems generally have sub-pixel displacement resolution and real-time dynamic analysis capabilities. The current status is characterized by a high degree of software and hardware integration, support for 2D/3D measurement and testing in complex environments such as high temperature and microscopic environments, and a number of commercially mature products have emerged both domestically and internationally. Future development trends focus on deep integration with artificial intelligence and deep learning technologies to achieve more intelligent speckle optimization, noise suppression, and data processing; at the same time, expansion towards high-speed dynamic measurement, micro/nanoscale applications, multi-physics field coupling analysis, and portability and online operation, promoting its real-time application in intelligent manufacturing and structural health monitoring.

The global Digital Image Correlation (DIC) System market size was estimated at USD 155.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 5.00% during the forecast period.
