Abstracts

A Digital Mobile Radio (DMR) repeater is a type of radio system that allows for two-way communication between two or more DMR radios over a greater distance than would be possible with a single DMR radio. The repeater receives the signal from the transmitting radio, amplifies it, and retransmits it at a higher power and/or a different frequency to extend the range of the communication. DMR is a digital radio technology that uses Time-Division Multiple Access (TDMA) to allow two simultaneous conversations on the same frequency, effectively doubling the capacity of a given channel compared to analog systems. This makes DMR repeaters more efficient than analog repeaters, as they can handle more traffic in the same amount of time.

The global Digital Mobile Radio Dmr Repeaters market size was estimated at USD 350.25 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 7.80% during the forecast period.
