## Abstracts

Digital Pathology Solutions are a comprehensive technology system that transforms traditional glass pathology slides into high-resolution whole-slide digital images using specialized scanning equipment. It then leverages artificial intelligence analysis software and an information management platform for pathological diagnosis, data management, remote consultation, and quantitative analysis. Its core processes include slide scanning, image storage, intelligent analysis, and networked applications. The system aims to break down physical and temporal limitations, enabling the digitization, visualization, and intelligentization of pathological resources, and serves as a key infrastructure for precision medicine and smart hospital construction. Digital Pathology Solutions' cost structure is centered on high hardware and ongoing software R&D investment, with cloud deployments also incurring significant server and maintenance costs. Gross margins are polarized: standardized hardware and software sales have higher margins (50%-70%), while overall project delivery, especially hybrid models involving ongoing services, has lower margins (approximately 30%-40%) due to implementation and customization costs. Scalability and software subscription services are key to improving profitability.

The global Digital Pathology Solutions market size was estimated at USD 587.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 6.10% during the forecast period.
