Report Overview

A digital photoconductive detector is a sensor used to detect electromagnetic radiation, typically within the infrared (IR) range. It is based on photoconductive materials, which change their conductivity when exposed to light. In digital photoconductive detectors, the photoconductive material is usually a semiconductor, such as silicon or germanium. When the material is exposed to IR radiation, the photons in the radiation are absorbed by the material, causing electrons to be excited and moved to higher energy levels. This leads to a decrease in the material's resistance, which can be measured and used to determine the intensity of IR radiation.
