Abstracts

Digital Smart Locker System is a type of locker that uses Internet of Things (IoT) technology to connect to the internet and provide people with a convenient way to store their belongings. These are especially popular in office and warehouse environments as the main advantage of a smart locker is that it allows people to keep both work and personal belongings safe and secure while giving the management an easy way to manage access. The market drivers for digital smart locker systems are the increasing adoption of smart parcel systems, especially during the COVID-19 pandemic, the rising demand for contactless and convenient delivery and storage solutions, and the growing awareness of consumers about the benefits and comfort offered by smart lockers. The constraints of digital smart locker systems are the high initial investments required for acquiring and installing the equipment, the need for regular software updates and maintenance, the limitations in terms of the size and shape of the items that can be stored, and the potential security risks of hacking or tampering. The future opportunities for digital smart locker systems are the development of new applications and use cases that can benefit from the smart locker technology, such as food delivery, library books, rental services, and asset management. Digital smart locker systems can also be integrated with advanced technologies such as artificial intelligence (AI), machine learning (ML), and cloud computing to optimize the process parameters and outcomes.

The global Digital Smart Locker System market size was estimated at USD 2744.0 million in 2025 and is projected to grow at a compound annual growth rate (CAGR) of 19.60% during the forecast period.
